

Domain-Specific Modeling

76 cases of MDD that works

17 November 2009

15:00-16:30 GMT

Steven Kelly

Outline

- Why Domain-Specific Modeling?
- Examples
- How to build
- Is this for you?

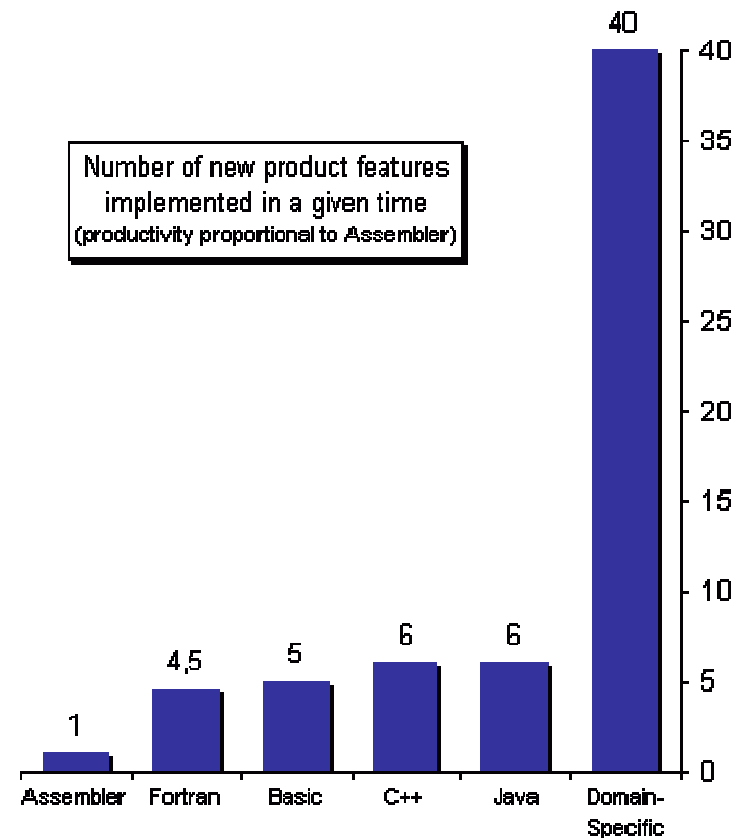

A rise in productivity is overdue

- "The entire history of software engineering is that of the rise in levels of abstraction"

Grady Booch

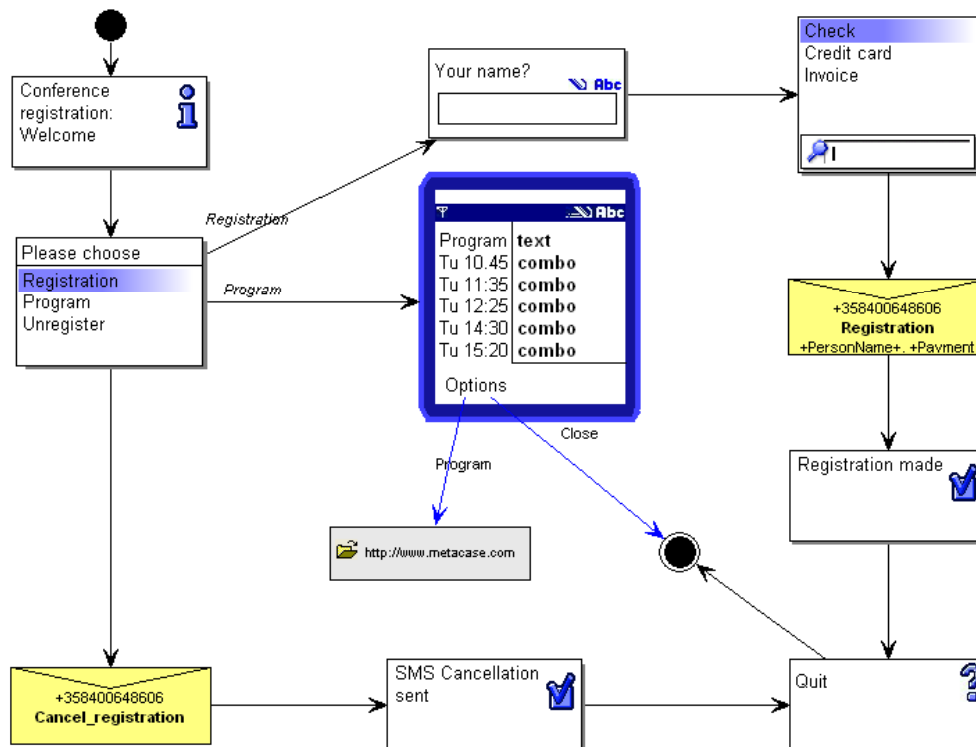

- New programming languages have not increased productivity
- Abstraction of development can be raised above current level...
- ... without losing control or accepting substandard results

*Software Productivity Research & Capers Jones, 2002

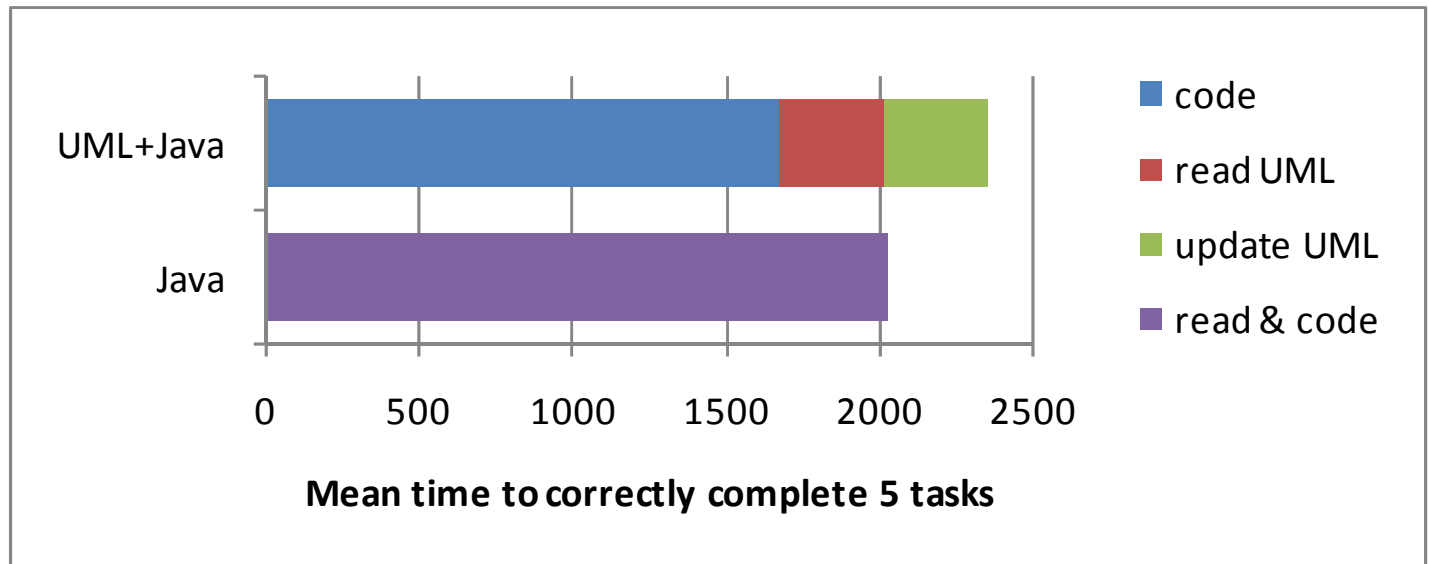

Enterprise smartphone app demo

Why not use standard UML?

- Using standard UML is really no faster than just coding
 - Scientific measurements from 48% slower to 10% faster
 - Recently –15% in: WJ Dzidek, E Arisholm, LC Briand, A Realistic Empirical Evaluation of the Costs and Benefits of UML in Software Maintenance, IEEE ToSE 34:3, 5/08

- **We need something more than standard UML!**

Abstraction benefits

... work on a higher level

... do more with less

... insulate from technology

Worst Practices for Domain-Specific Modeling

Steven Kelly, Risto Pohjonen

IEEE Software, vol. 26, no. 4, pp. 22-29, July/Aug. 2009

Free from: www.metacase.com/stevek.html

- 76 DSM cases
- 15 years
- 4 continents
- several tools
- 100 DSL creators
- 3–300 modelers

Worst practices: Concept Source

UML: Old Wineskins

Extend a large, general-purpose language

+

!=

3GL: Visual Program

Traditional programming
language + graphics

1 symbol => 1 keyword ☹️

MDA: UML+UML+UML

Multiple semi-automatic
transformations

!=

MDA: UML+UML+UML

Multiple semi-automatic transformations

**Manufacturers' claims:
+22% (Obeo) ... +35%(OpJ)**

Not enough!

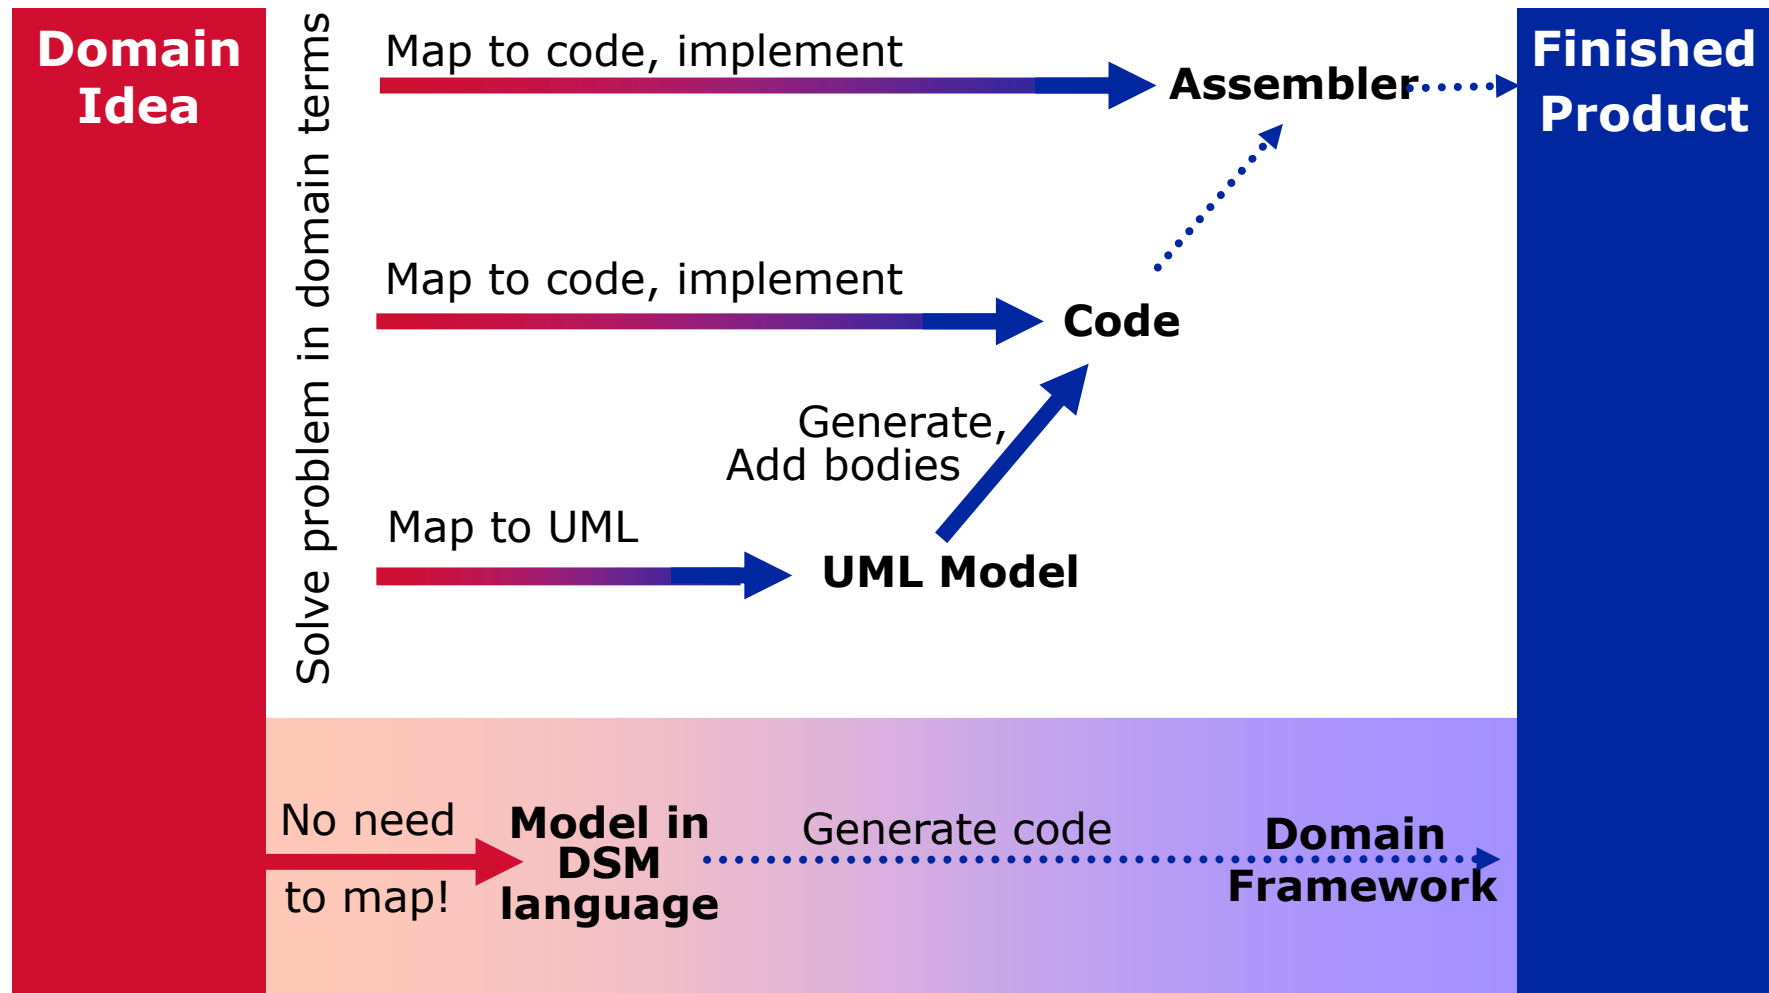

Booch, Rumbaugh and Selic say:

- “the full value of MDA is only achieved when the modeling concepts map directly to domain concepts rather than computer technology concepts”
 - An MDA Manifesto, MDA Journal, May 2004
- Use language of problem domain
- Generate language of solution domain

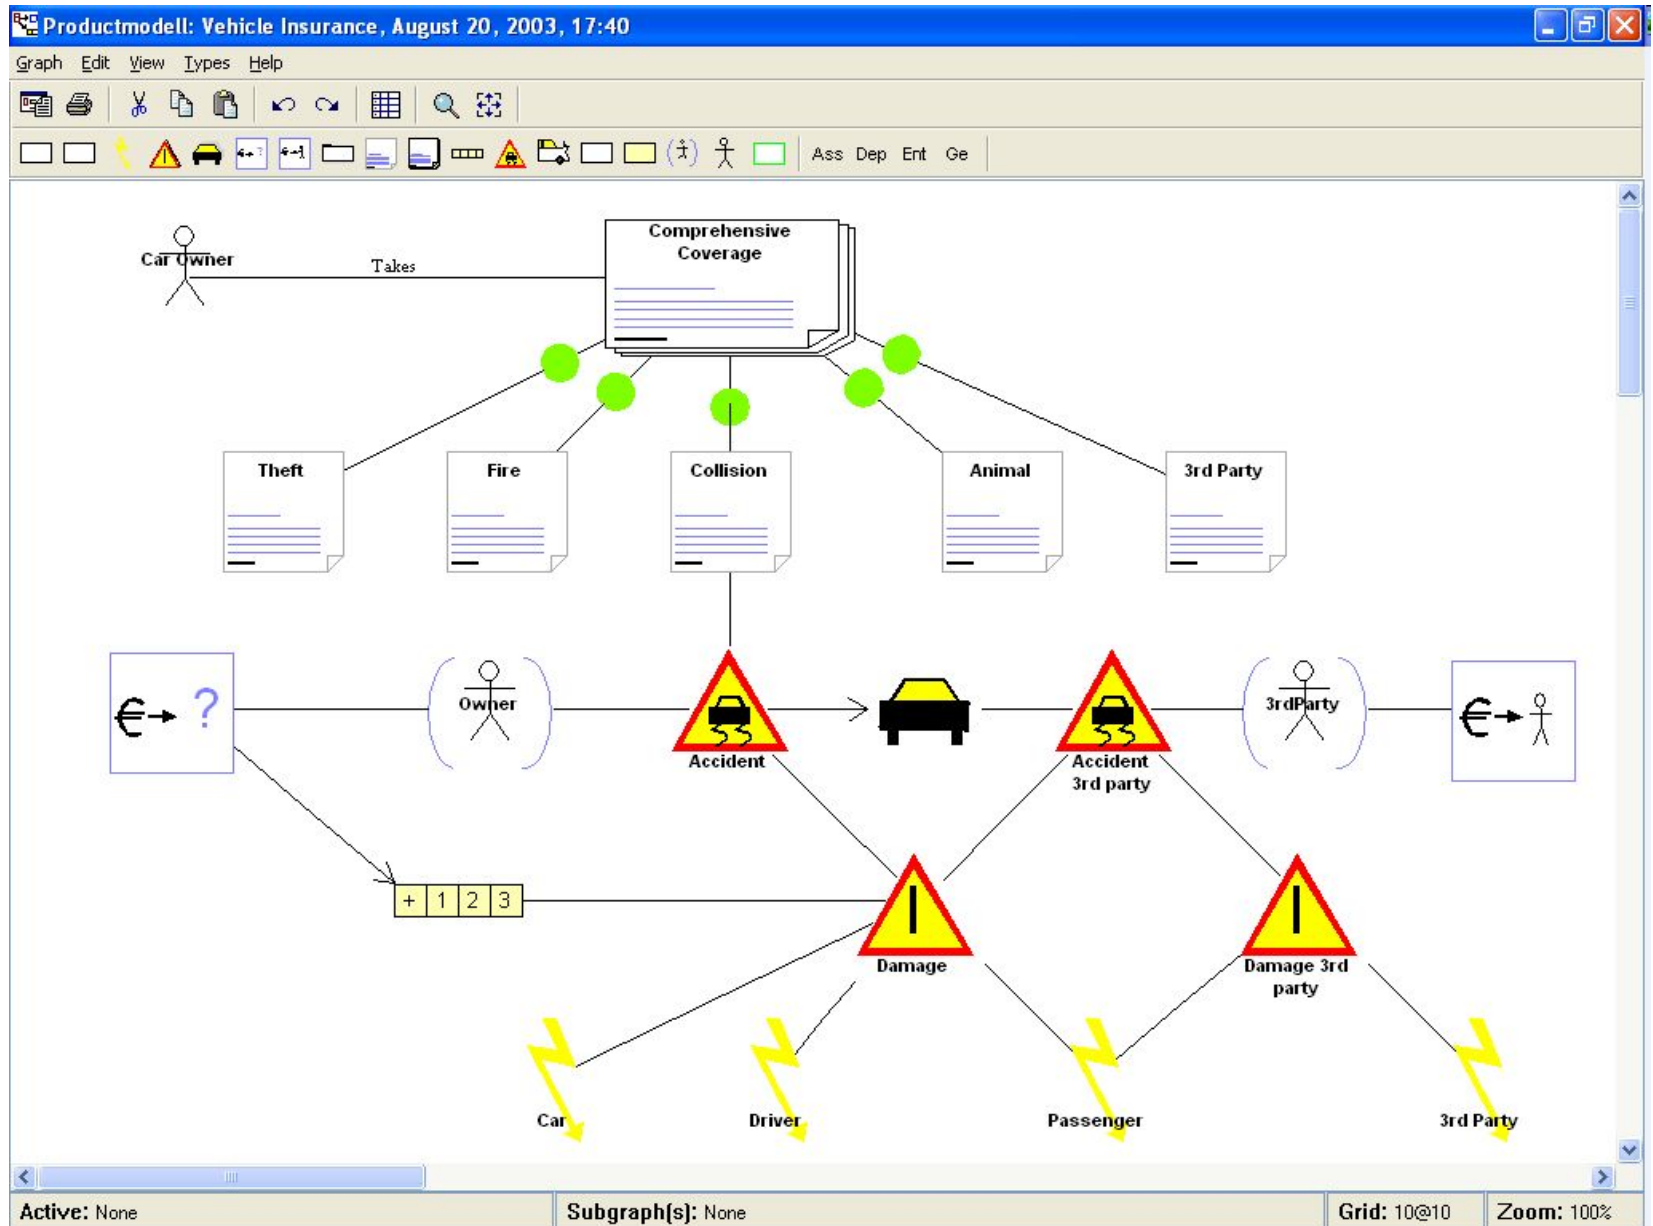

Modeling functionality vs. modeling code

Case: Financial web application

- Developing portal for insurances and financial products
 - Need to specify several hundred financial products
 - Insurance experts visually specify insurance products and generate code to the portal
- Comparison to hand-writing Java after first 30 products = DSM 3-5 times faster, 50% fewer errors

public class Basis extends ProductRepository
{
    public Basis(String name)
    {
        super(name);
        PRODUCT_NAME = Basis;
        MofPackage productpackage = createProduct();
        this.addMofPackage(productpackage);
    }

    public Basis()
    {
        // name of namespace ProductRepository not used
        this(Basis);
    }

    private MofPackage createProduct()
    {
        productpackage_ = new MofPackage(PRODUCT_NAME);

        // Global Instances, will be re-used by each section
        MofAttribute attribute;
        MofAssociation mofAssociation;
        Constant constant;
        AssociationEnd end1;
        AssociationEnd end2;
        Reference reference;

        // *****
        // Tags
        // *****
        beitragsicht_ = new Tag("Tarifizierung", MofModelConstants.TAGID_TARIFI);
        productpackage_.addContainedTag(beitragsicht_);

        selektionssichtTrue_ = new Tag("Selektion_true", MofModelConstants.TAGID_TARIFI);
        selektionssichtTrue_.addValue("True");
        productpackage_.addContainedTag(selektionssichtTrue_);

        anbotssicht_ = new Tag("Angebot", MofModelConstants.TAGID_ANGEBOT);
        productpackage_.addContainedTag(anbotssicht_);

        // *****
        // Exceptions
        // *****
        MofException Exception1 = new MofException ("Exception1")
        parameter = new Parameter("ExcepParam1", new DataType("Haftung"));
        .addParameter(parameter)
        parameter = new Parameter("ExceptionParam2", new DataType("string"));
        .addParameter(parameter)
        .addParameter(parameter)
    }
}
```

Case: Call Processing Services

- Specify services than can run safely on Internet telephony servers
- Designs can be considered valid and well-formed right from the design stage
- Language uses concepts familiar to the service developer
 - Switches, Locations and Signaling actions etc.
- Generate full service from the model
- Creation of new services 6 times faster compared to manual practices

```

Done My Computer

Case: Process of medical mixing

- Single fixed physical machine
- Product variability in software: how to mix
- Platform has 11 cups, syringe to transfer between
- Problems in hand-coded software quality:
 - Syringe broken, operator died, patient treatment error
- Competition by ICT to find best DSM solution
 - Reduced from 277 pieces of input to 29

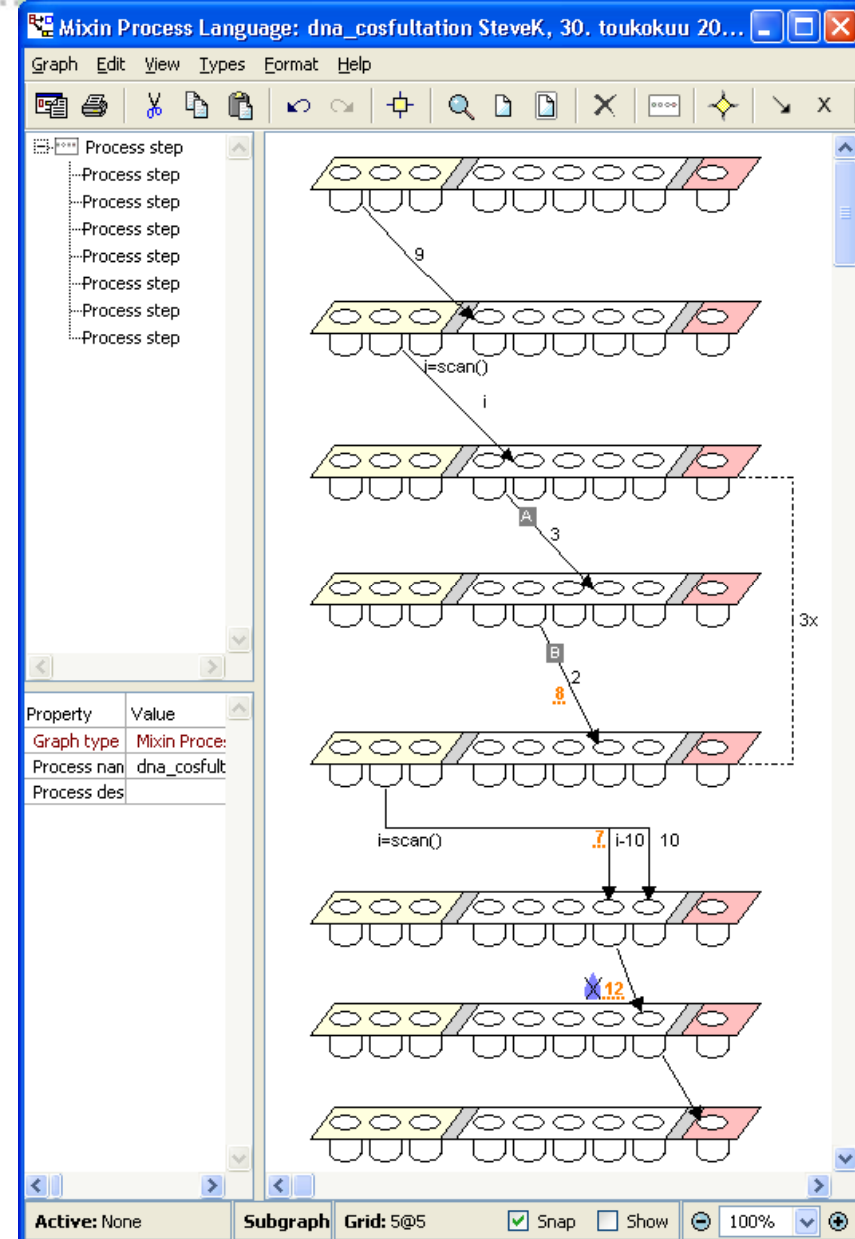

```

class DNAMixingMachine extends MixingMachine
{
    int dna_cosultation()
    {
        double i,j;
        shut(0);
        move(-4);
        if(scan() != 9) return -1;
        suck(9); move(5); blow(9);
        move(-2); suck(30); move(1); blow(30);
        move(-3);
        if(scan() < 6) return -1;
        i = scan(); suck(i); move(5); open(0); blow(1);
        move(-3); suck(30); move(1); blow(30);
        move(1); filit(1); suck(3); move(3); filit(0); blow(3);
        move(-5); suck(30); move(1); blow(30);
        move(2); filit(2); suck(2);
        move(2); filit(0); blow(2);
        wait(8);
        move(-5); suck(30); move(1); blow(30);
        move(1); filit(1); suck(3); move(3); filit(0); blow(3);
        move(-5); suck(30); move(1); blow(30);
        move(2); filit(2); suck(2);
        move(2); filit(0); blow(2);
        wait(8);
        move(-5); suck(30); move(1); blow(30);
        move(1); filit(1); suck(3); move(3); filit(0); blow(3);
        move(-5); suck(30); move(1); blow(30);
        move(2); filit(2); suck(2);
        move(2); filit(0); blow(2);
        wait(8);
        move(-5); suck(30); move(1); blow(30);
        move(2); i = scan(); suck(i); move(3);
        if(i < -10) {blow(i); j = -i;}
        else {blow(10); j = 10;}
        move(-1); blow(i-j);
        wait(7);
        move(-5); suck(30); move(1); blow(30);
        move(4); suck(3+2+3+2+3+2+1-j); move(1); blow(3+2+3+2+3+2+1-j);
        wait(12);
        suck(3+2+3+2+3+2+1); shut(1); move(1); blow(3+2+3+2+3+2+1);
        move(-7); open(1); suck(30); move(1); blow(30);
        return 0;
    }
}

```

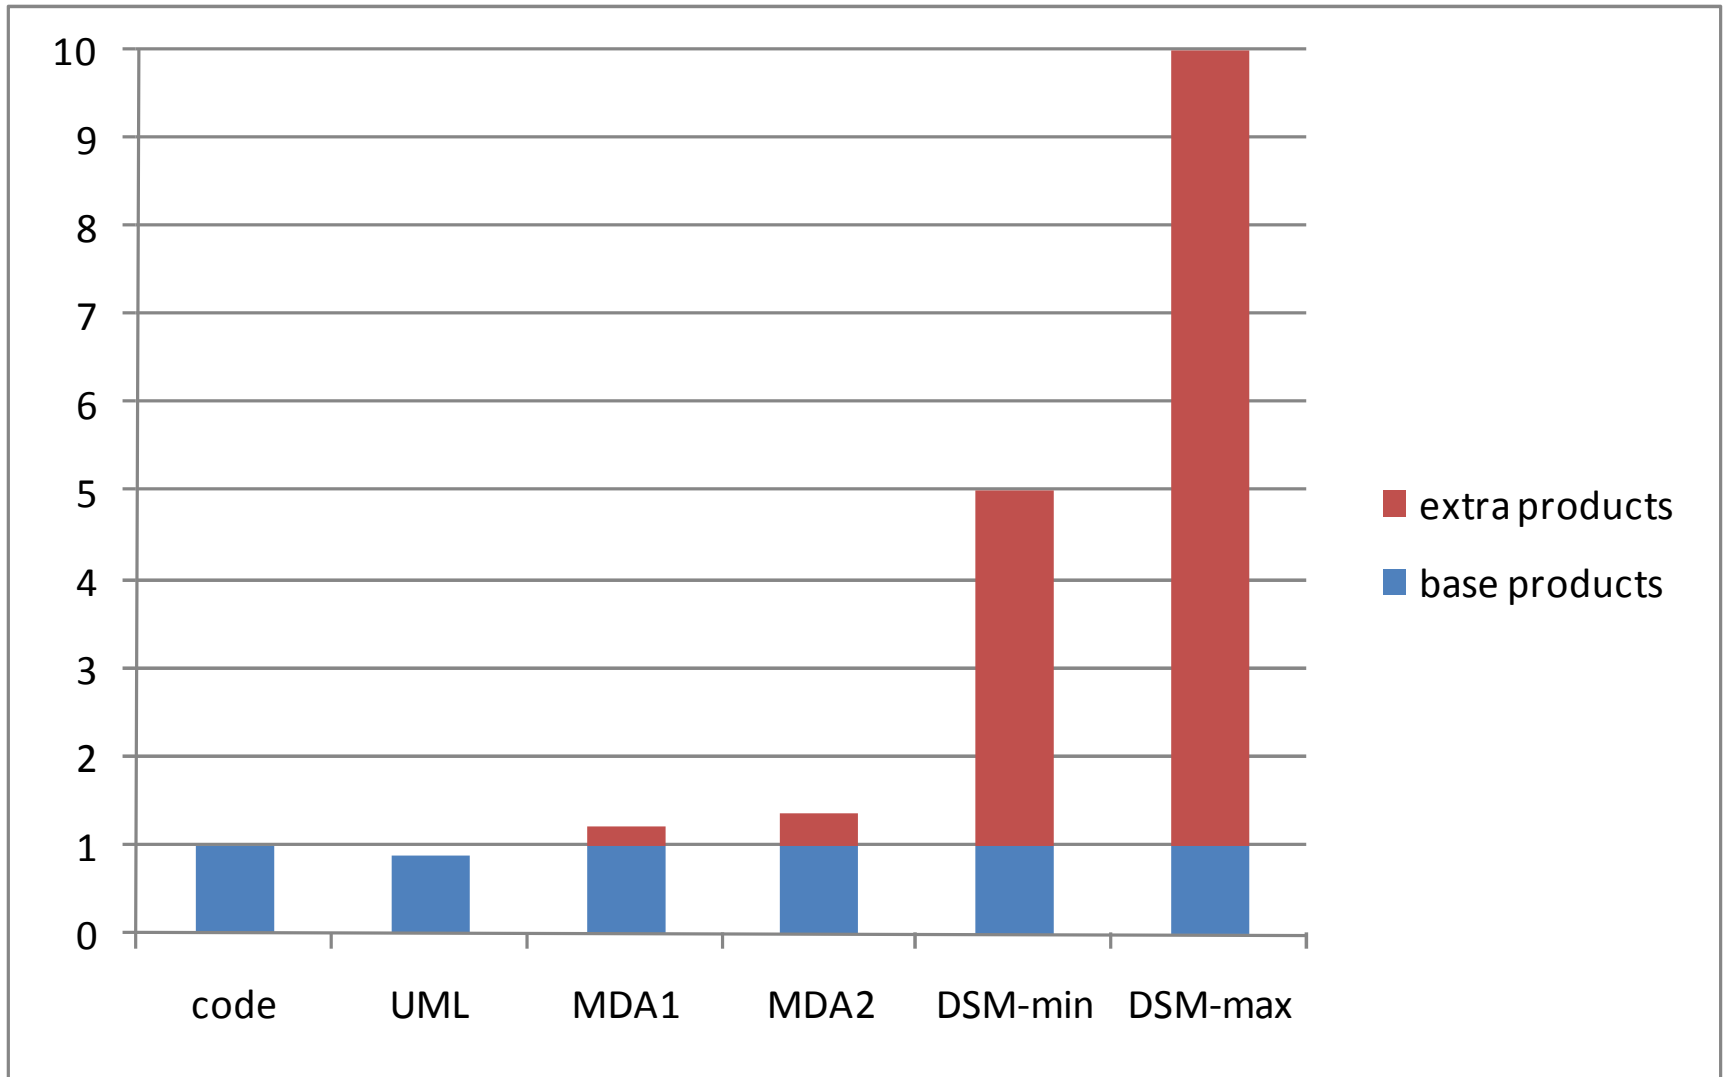

Productivity increase from DSM

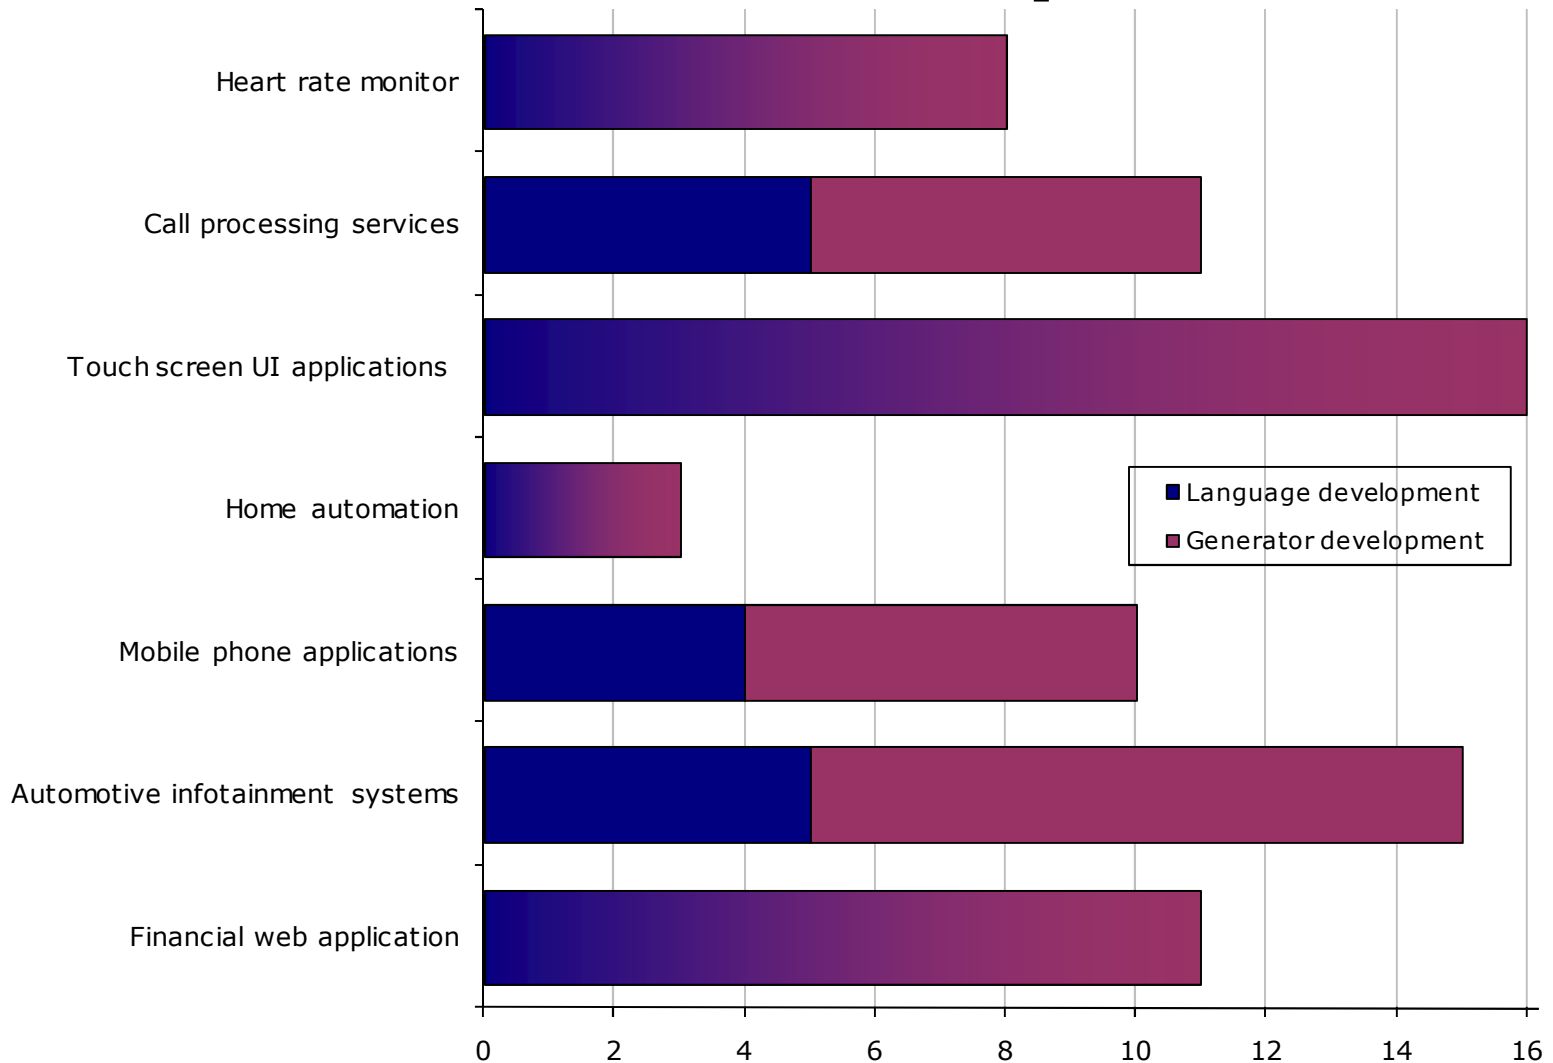

DSM consistently 5-10x faster

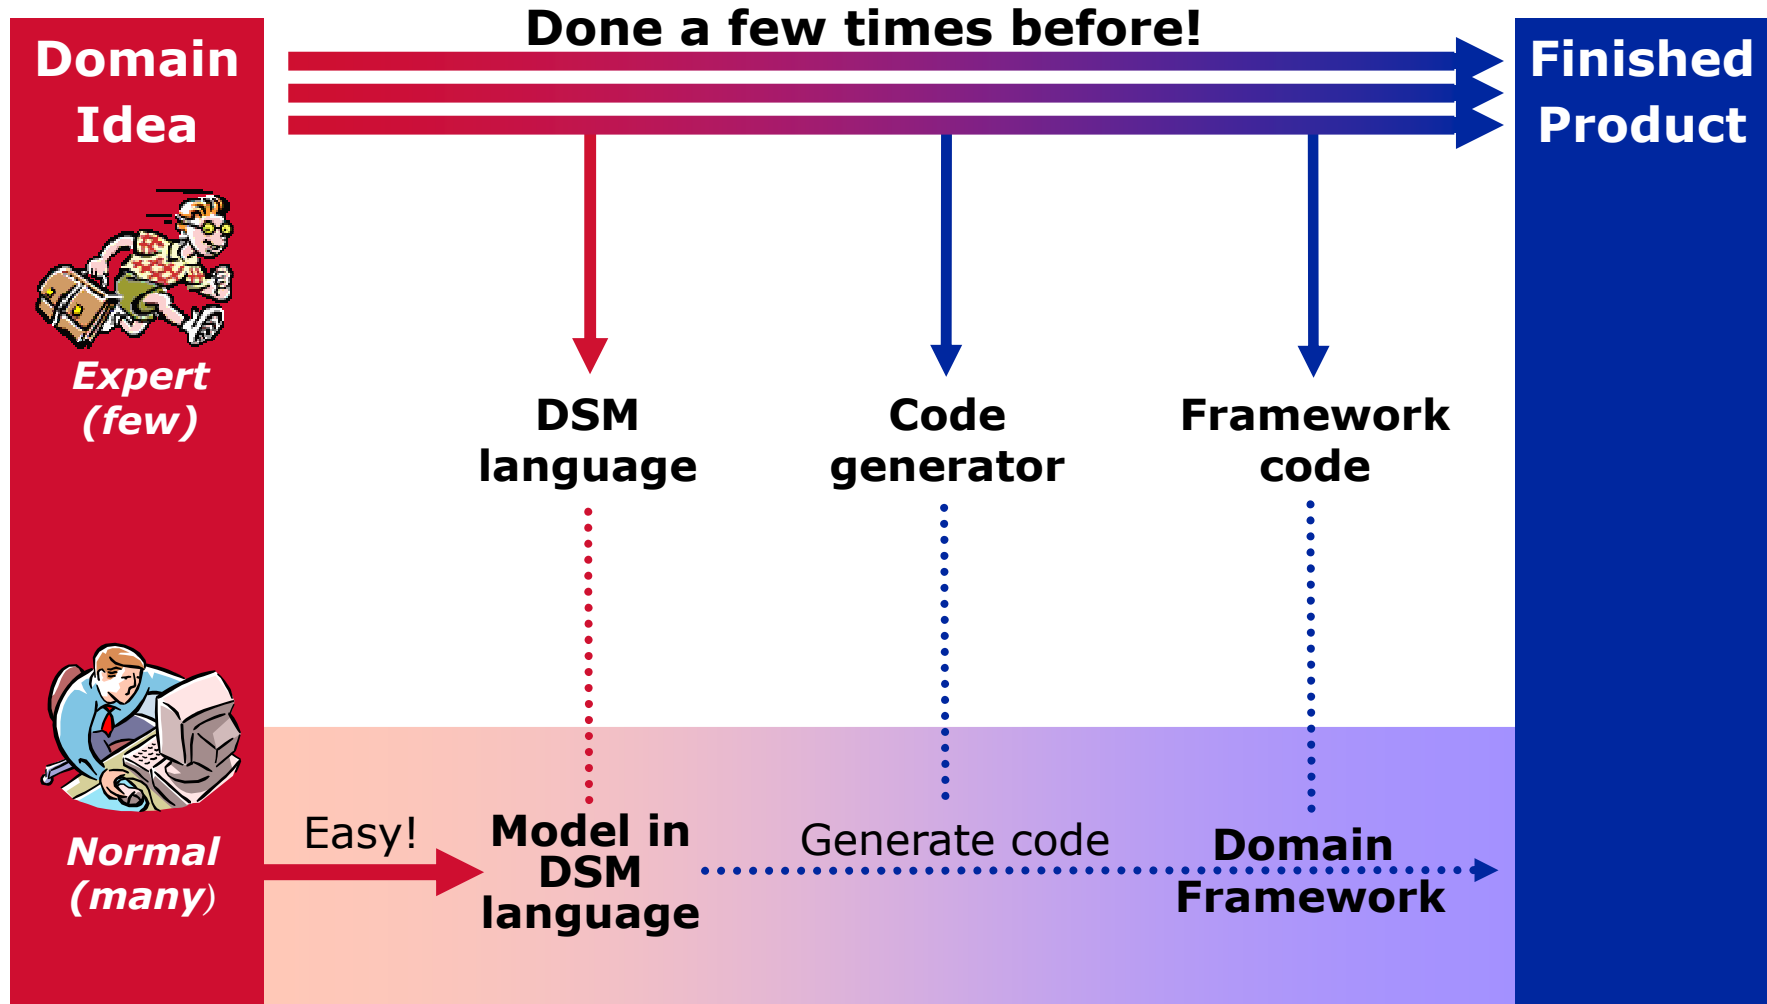

DSM Solution Development Time

How to implement DSM

Getting started

A journey of 1000 miles
begins with a single step

Setting off on the wrong foot
can spoil the whole journey

Only Gurus Allowed

Only gurus build
languages **4%**

I'm smart & need
no help **12%**

Domain Dilettante

Insufficient understanding:

- Problem domain 17%**
- Solution domain 5%**

**Never, ever
delegate to
interns!**

Analysis Paralysis

Language must be
known to be **complete**,
fully implementable 8%

Sources for the Language

Tool: hammer \Rightarrow nails

**Tool's technical limitations
dictate language **14%****

Approaches to identify concepts

- “What concepts should my language have?”
 - Hard problem for DSM beginners
 - Analysed 23 cases to find good toolbox of approaches*

- 4 main approaches:

* Tolvanen, J.-P., Kelly, S., 2005:

Defining Domain-Specific Modeling Languages to Automate Product Derivation: Collected Experiences. Proceedings of the 9th International Software Product Line Conference, H. Obbink & K. Pohl (Eds.) Springer-Verlag, LNCS 3714, pp. 198–209

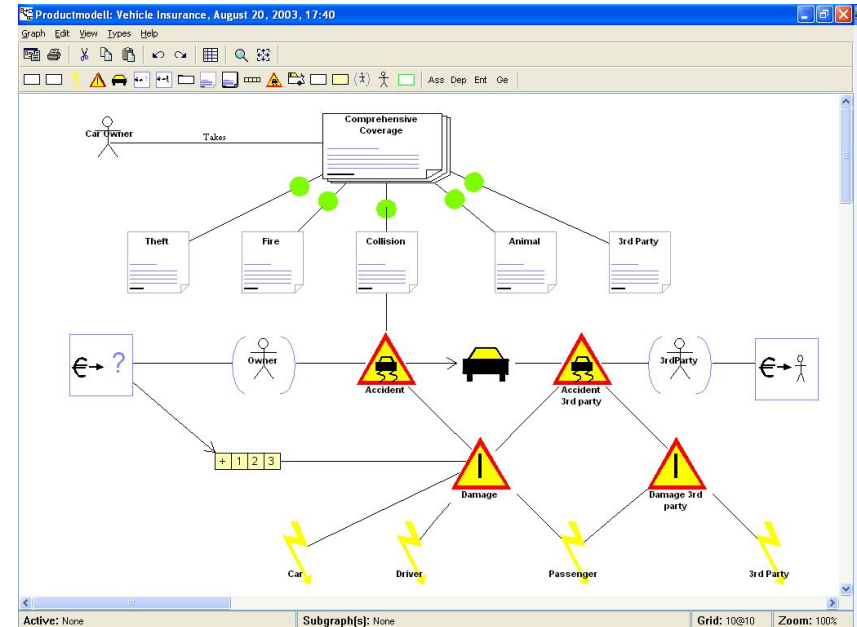

Problem domain	Solution domain/ generation target	Approach
Telecom services	Configuration scripts	1
Insurance products	J2EE	1
Business processes	Rule engine language	1
Industrial automation	3 GL	1, (2)
Platform installation	XML	1, (2)
Medical device configuration	XML	1, (2)
Machine control	3 GL	1, 2
Call processing	CPL	2, (1)
Geographic Information System	3 GL, propriety rule language, data structures	2
SIM card profiles	Configuration scripts and parameters	2
Phone switch services	CPL, Voice XML, 3 GL	2, (3)
eCommerce marketplaces	J2EE, XML	2, (3)
SIM card applications	3 GL	3
Applications in microcontroller	8-bit assembler	3
Household appliance features	3 GL	3
Smartphone UI applications	Scripting language	3
ERP configuration	3 GL	3, 4
ERP configuration	3 GL	3, 4
Handheld device applications	3 GL	3, 4
Phone UI applications	C	4, (3)
Phone UI applications	C++	4, (3)
Phone UI applications	C	4, (3)
Phone UI applications	C++	4, (3)

1. Domain expert's concepts

- Concepts from domain
- Mostly made without help
- Simple code generation
- OK in established domain
- Usable by non-coders

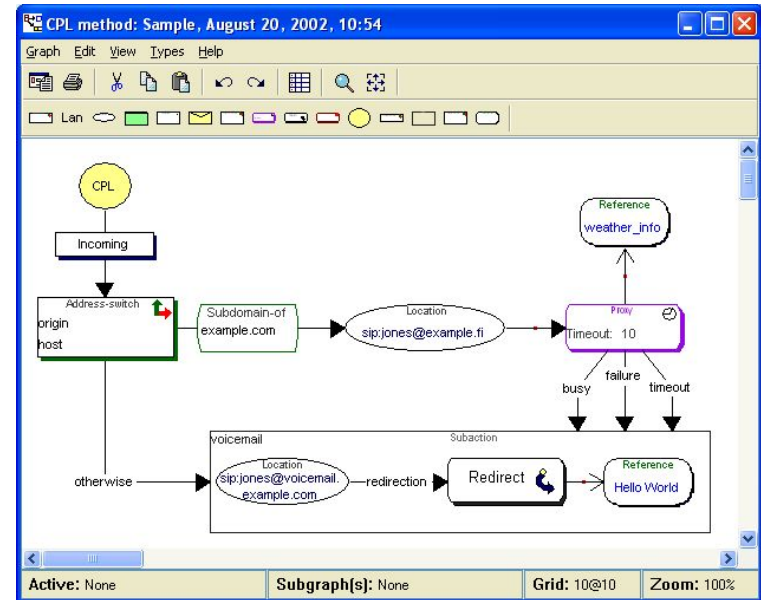

Insurance products/J2EE

2. Generation output

- Modelling constructs come from code artefacts
 - Data structures
 - Core XML elements
- Static parts are easy
 - Data structures
 - Core XML elements
- Dynamic behaviour harder
 - Avoid "graphical 3GL"
 - Need domain framework
- Danger: low level of abstraction
 - Little productivity gain
- But works well with DSL or XML

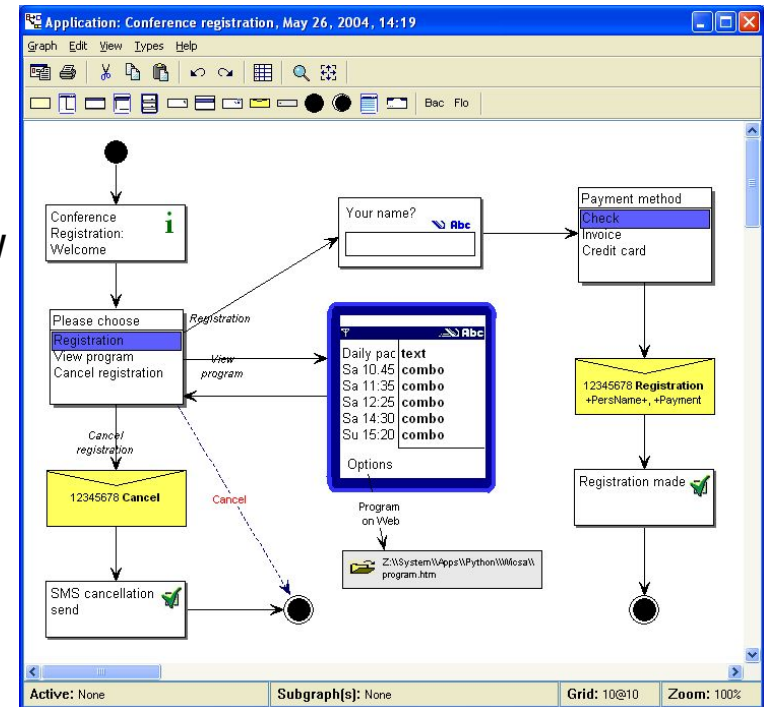

Internet telephony/CPL

3. Look and feel of end system

- Best for physical end product
 - UI on PC, embedded, speech
- Often state machine basis
 - Extend with data & control flow
 - Power of relationships
- Visible domain concepts
 - Easy to identify
 - High level of abstraction
- Domain framework hides code
 - Don't write code in models...
 - ...unless you really have to!
- Generators considered easy

Smartphone apps/Python

4. Variability space

- Language concepts capture variability space
- Modeler makes variant choices
 - Composition, relationships, values
- Infinite variability space (Czarnecki)
 - Not just feature tree: unbounded product family
- Static variance easy, dynamic harder
- Predict future variability \Rightarrow high level of abstraction

Evaluation of the Approaches

- Hierarchy of approaches
 - From less to more experienced DSM practitioners
- 1. Domain expert's concepts – "we just did it"
- 2. Generation output
 - Generic/ad hoc language not so good
 - Established DSL good
- 3. Look and feel: common, easy, true DSM
- 4. Variability space: adds power to handle complexity
 - Found in very different domains
- Best results combined 3 (L&F) and 4 (Variability)

Too generic/specific

Too few/generic 21%

Too many/specific 8%

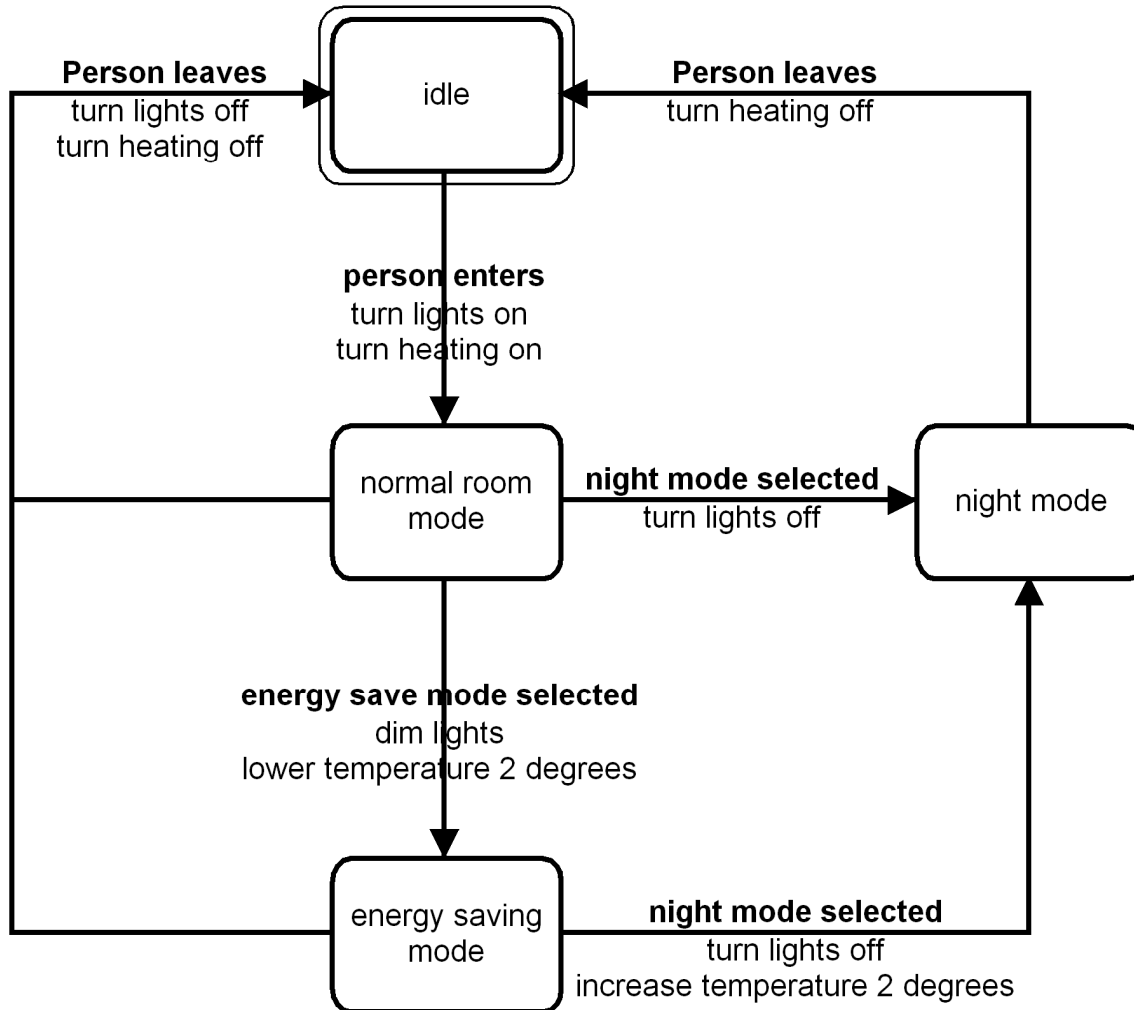

Language for 1 model 7%

Simplistic symbols

Too simple/similar 25%

Downright ugly 5%

Not like this...

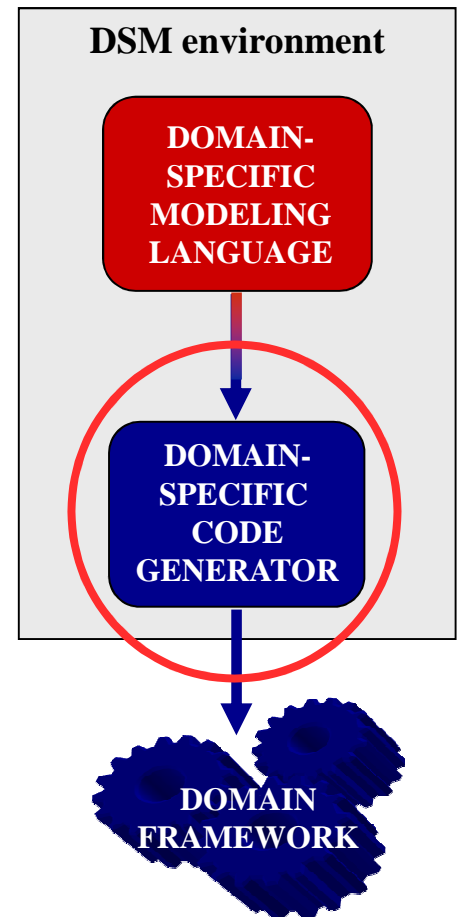

Not a
DSL!

Add
heating,
lights?

What about the generator?

- Generator translates the models into the required output
 1. crawls through the models
 - navigation based on metamodel
 2. extracts required information
 - access data in models
 3. outputs it into the code
 - mixing fixed text and model data
 4. with translation where necessary
 - e.g. space to underscore, XML legal

How to make a generator

- Make generated code based on current hand-written code
 - Removes risk of slow, bloated or unreadable code
 - Follow good coding standards, include comments, have data to link back to models (e.g. in comment or via simulator)
- Make generation process complete, target 100% output
 - Never modify the generated code
 - Correct the generator or framework instead
 - Or use add-in hand-coded functions
- Put domain rules up-front to the language
 - Generator definition becomes easier when the input is correct
- Try to generate as little code as possible
 - Glue code only, rest in domain framework or platform
- Keep generator as simple as possible
 - Push low-level implementation issues to the framework
 - Keep generator modular to reflect changes

Is DSM worth it?

- Language workbenches make moving to DSM feasible
 - Can focus on language design, not on creating tooling
- Creation of languages does not take much time

Is DSM for you?

- You probably can't know yet!
 - Have to try it out for your situation
- If it does fit your situation, the 500-1000% makes it probably the single most important thing you can do
 - More than SOA, cloud, Ruby, agile, ...
- How to see quickly if it would work for you:
 - Look for repetition in your work, e.g.:
 - many screens and database tables
 - many products in family
 - etc.
 - Try out a tool
 - Tutorials
 - Have a go with your domain (ask for hints)

Thank you!
